Fox Medical Health Clinic

Booking Confirmation:

Patient: John Doe
Patient ID: 12345
Department: Optometry
Health Care Provider: Dr. Sheldon Cooper
TimeSlot: Tuesday 3/10/2026, 10:30am - 11:30am
Appointment ID: OPT-987-654-321

Thank you for booking an appointment with us.

Page Controller:

For this assignment I am creating a medical scheduling system called 'Fox Medical Health Clinic.' Since this app is relatively small with only a handful of major features, I decided to implement the Page Controller design pattern which is more suited to small scale projects like this one. The basics of the Page controller are as follows. Each page has an associated 'controller' to go with it. These controllers are responsible for handling specific get/post requests for the page. The controllers also are responsible for preparing data for the model of the system so that it can be easily passed and accessed in all layers. Controllers will also return the html to view so that users can see the relevant information.

Data Flow for App:

Going over the flow of a request in my app we have a layered architecture. There are the Controllers, the Services, and the DB handlers. Lets say that the user wants to book their appointment:

1. The controller receives a request /appointments/book, and renders the html
2. The user enters information which is collected by the controller
3. This information is turned into an Appointment object
4. The object is passed to Service layer where the appointmentBookingService takes that object, talks to the DBHandler to check if that appointment is available and doesn't have any conflicts.
5. If not conflicts the appointment object is passed to the DBHandler where it will be logged in the MySQL DB.

6. The appointmentBookingService then passes that confirmed appointment to appointment booking controller, where it is then updated in the model as to being book and is reflected in the html
7. Controller then redirects user to the booking confirmation page.
